Ba ttery energy storage systems (BESS) are expected to play an important role in the future power grid, which will be dominated by distributed energy resources (DER) based on renewable energy [1]. Since 2020, the global installed capacity of BESS has reached 5 GWh [2], and an increasing number of installations is predicted in the near future.

The traditional electric power grid connected large central generating stations through a high-voltage (HV) transmission system to a distribution system that directly fed customer demand. Generating stations consisted primarily of steam stations that used fossil fuels and hydro turbines that turned high inertia turbines to produce electricity.

In the context of the global energy landscape restructuring driven by the "dual-carbon" goals, new energy storage technologies have emerged as a critical enabler for energy transformation and the development of a new power system.
