36V - 12V= 24V. $24V \times 15A =$ a whopping 360W of heat. Most of the power from the battery is being wasted by making heat which is very inefficient. Instead make a SMPS which switches the output on and off at a high frequency. It wastes only about 18W making heat. Like Reply. mik3. Joined Feb 4, 2008

same voltage. How many watts is that 36V panel? Let's say for example that it is a 300W panel putting out 8.33A at 36V. So, your two parallel strings would be 5.5A at 36V and 8.33A at 36V, for a total of 13.83A at 36V.

This series of 12V DC to 36V DC boost converters have wide input range of 10V to 25V, output power from 36W to 1080W, different models are optional. Low price DC-DC step up power modules, are provided with overload protection, ...

36V at 25A is 900W. If you make a voltage booster to convert 12V to 36V then it wastes about 15% of the power which is 135W. Then the 12V source must provide 1035W. Then the 12V current in the booster is $(1035W/12V) = 86.25A$. That is a welder, isn't it? The wires are as thick as your fingers? Why bother making a new inverter to feed the 36V ...
