

Vietnam Ho Chi Minh Energy Storage Container Industry and Commerce

Where are special seaports planned in Ho Chi Minh city?

Special seaports are planned in Thanh Hoa, Da Nang, Khanh Hoa, and Ho Chi Minh City. The revised plan includes relocating wharves on the Saigon River and considering other relocations in alignment with Ho Chi Minh City's urban development. The investment needs for cargo handling service wharves by 2030 is estimated at \$13 billion.

How can Vietnam improve its energy infrastructure?

Along with that is the need for a better prepared and capable cybersecurity system to enhance Vietnam's ability to protect critical energy infrastructure. Energy storage: Using energy storage technologies will help Vietnam effectively manage the grid and integrate renewable energy sources.

How can US companies benefit from Vietnam?

U.S. companies can also benefit from Vietnam's favorable policies and incentives for renewable energy development. Energy efficiency solutions: The PDP8 defined the importance of innovative solutions to address energy and environmental issues. U.S. firms can play a leading role and supply many of the energy-saving solutions Vietnam requires.

How can the US help Vietnam improve energy security?

The participation of the U.S. industry in energy management solutions, automation systems, and smart appliances will support Vietnam in ensuring its energy security and developing a sustainable industrial sector with efficient, digitally enabled, 'smart' power that is the core of the development.

Which basin can store CO₂ emitted from Da Nang CCS hub?

This basin has a CO₂ storage capacity of 6.7 Gt, enough for 184 years of storage, while the Phu Khanh Basin is the closest sink to store the emission from Da Nang CCS hub. We propose constructing a new 100 km-long CO₂ pipeline from Da Nang to transport 15 Mtpa of emitted CO₂ to a saline aquifer in the Phu Khanh Basin for storage.

How much CO₂ is stored in Vietnam?

There is 186 Gt of mid-CO₂ storage capacity in Vietnam's sedimentary basins, enough to store 832 years of CO₂ emission from stationary sources. Of this, 182 Gt (98%) comes from saline aquifers, 2.8 Gt (1.5%) from gas reservoirs, and only 0.5 Gt (0.3%) from oil reservoirs.
